# Global Terrorism Analysis

By: Neil Liberman

---

# Introduction to the Data

- A list of every terrorist attack from 1970-2015
  - Date, Country, Region, Type of Attack, Target(s), etc.
- Missing all entries for 1993

Total Bombings by Region (1970-2015)

# Bayesian Inference

Analyzing South American terrorist attacks.

After seeing the mean number of terrorist attacks in South America, I chose to analyze the bombings in South America 10 years before and after Pablo Escobar's death.

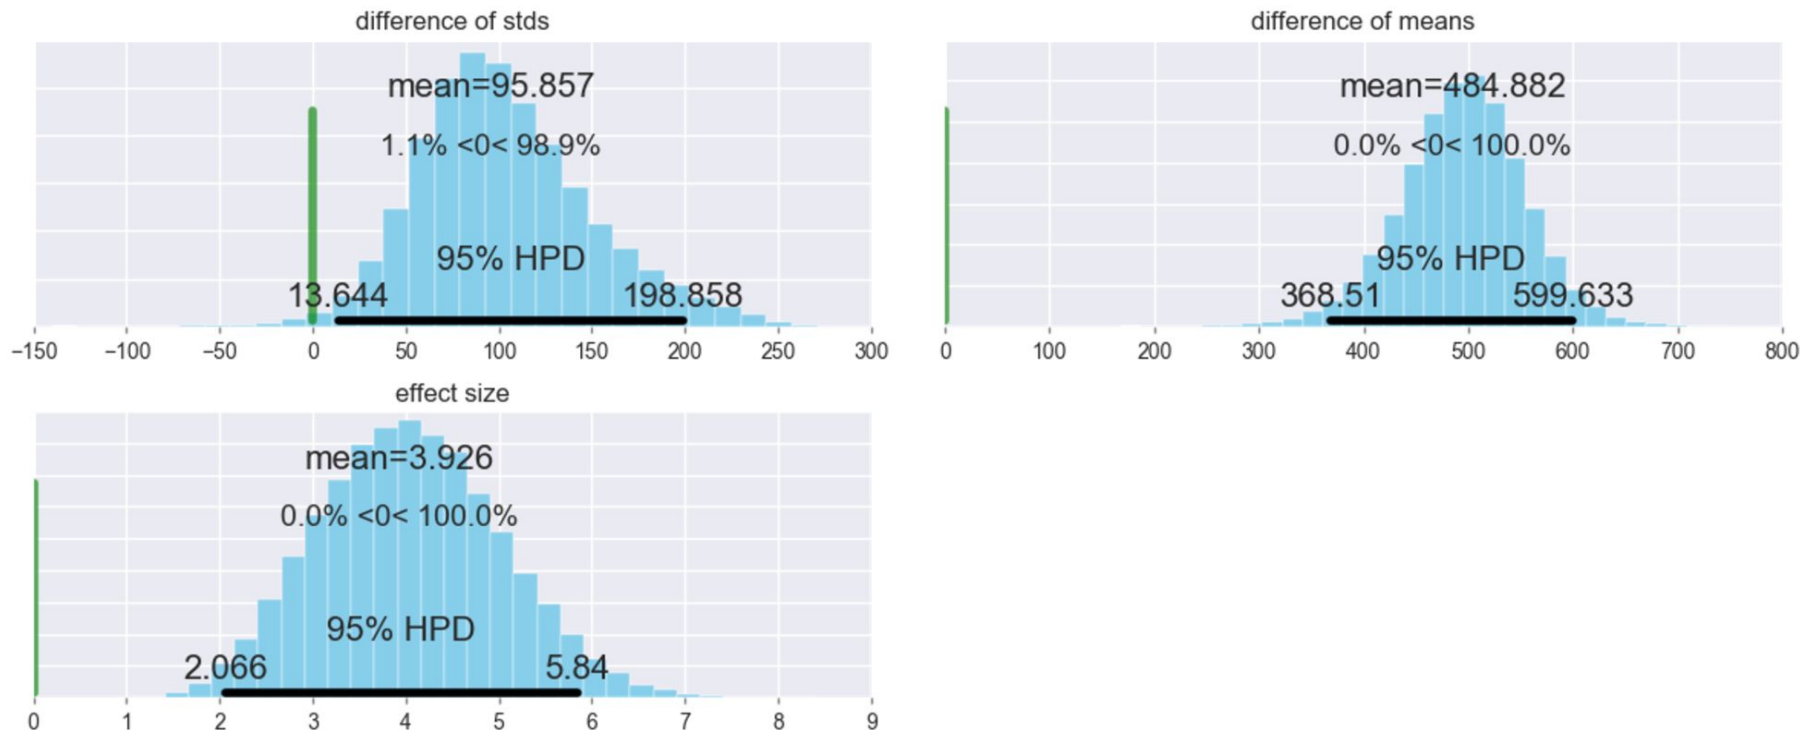

---

---

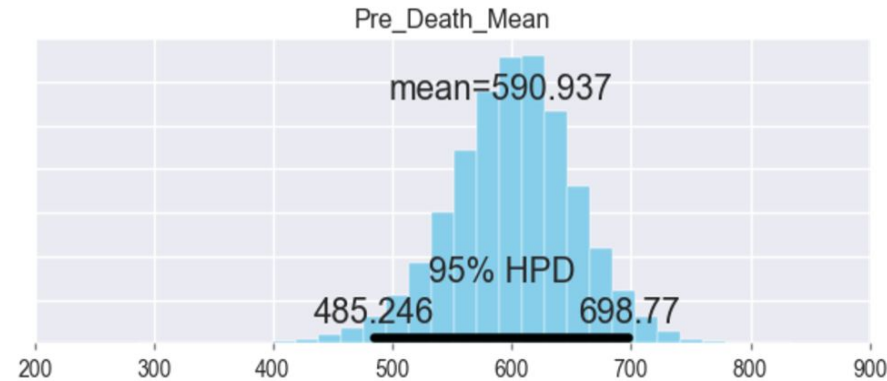

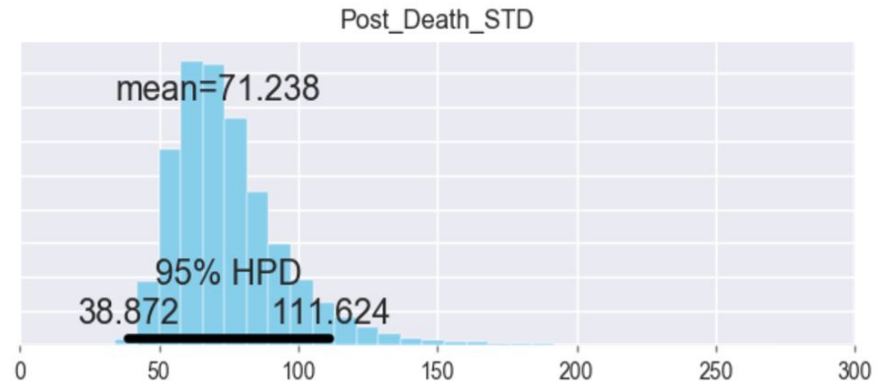

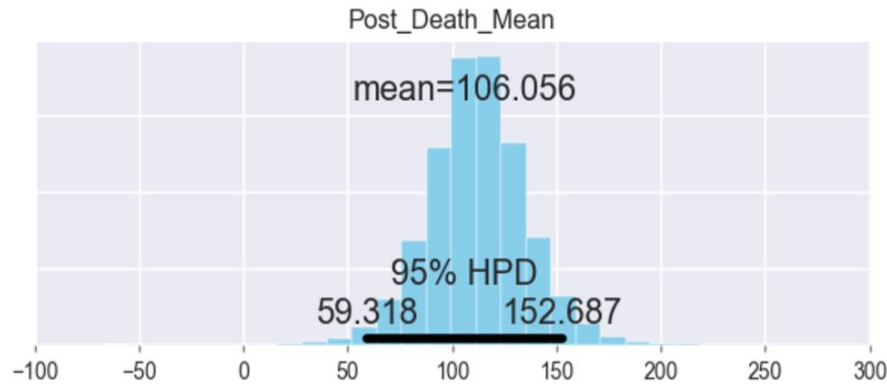

# Constructing a Prior

- Prior beliefs were rooted in the breakdown of terrorist attacks by region.
  - Prior: Average Bombings per Year in South America from 1970-2015
    - Mean: 198, SD: 239
  - Chose this prior due to my complete uncertainty about whether South America's distribution changed.
-

# PyMC Output

The 95% HPD does not overlap with zero. In other words, when we subtract the means of the two groups, that difference isn't close to zero.

Terrorist Bombings Per Year Pre Escobar's Death: 591  
Terrorist Bombings Per Year Post Escobar's Death: 106

# What Do These Graphs Say?

The samples are statistically  
significantly different!

Intuitively this makes sense

There's a 95% probability the mean  
bombings from 1983-1992 is  
between 485-699

There's a 95% probability the mean  
bombings from 1994-2003 is  
between 59-153

---

Bombings in South America by Year

---

# **Did Escobar's Death Cause this Drop in attacks?**

It would be inaccurate to say Escobar's death caused this drop, however, the massive drop in South American attacks would signal the possibility that it was a large contributing factor.

---

---

# Imputing Bombings for 1993

## Methodology:

Group the data by region and average the total bombings from 1990 - 1996 by each region. Sum the regional averages.

Total Calculated Bombings: 1431

Use the percentage of terrorist attacks that were bombings from 1990-1996. Multiply by the total number of incidents according to the GTD appendix.

Total Calculated Bombings: 1837

---

# Aggregating the Two Methods

Performed a simple average:

$$(1431 + 1837) / 2$$

Final Estimated Bombings Per Year:  
1634

---
